

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A method for permanently deforming a flexible film material, in which the film material is deformed, comprising the steps of:
 - providing a positive and negative mould ~~each having a lower edge portion and a central upper portion;~~
 - placing a film material between the positive and negative moulds, the film material having edge portions;
 - forming a single receptacle depression in the film material between the moulds;
 - providing tension on the film material in order to stretch it without forming creases in a central portion of the depression;
 - ~~controlling and reducing the tension of the film material while it is being moulded in order to draw [{}], wherein~~
additional film material ~~is allowed to penetrate between the positive and negative moulds in order to -which form~~
lateral creases are formed in the film material around the entire ~~lower edge -portion of the mould~~ film material while the film material in the central upper portion of the mould retains its original shape during the deforming procedure.
2. (Canceled)
3. (Previously presented) The method as claimed in Claim 1, wherein the tension is controlled by applying a controlled retaining force to peripheral regions of the film material.
4. (Previously presented) The method as claimed Claim 1, wherein the tension is controlled by moving peripheral

regions of the film material towards one another in a controlled manner.

5. (Previously presented) The method as claimed in Claim 4, wherein the peripheral regions are moved a specific distance towards one another.
6. (Previously presented) The method as claimed in Claim 4, wherein the peripheral regions are moved parallel to one another or towards one another in radial directions.
7. (Currently amended) The method as claimed in Claim 1, wherein the tension is controlled in such a manner that, in the region of the receptacle depression, a substantially crease-free central region is formed and a region along the entire ~~lower edge portion of the film material~~ lower edge portion of the film material is formed with controlled lateral creases.
8. (Previously presented) The method as claimed in Claim 1, wherein the film material is brought to a controlled temperature before or during the deforming process, which makes permanent deformation of the film material possible.
9. (Previously presented) The method as claimed in Claim 8, wherein the temperature is raised or lowered during the deforming process.
10. (Previously presented) The method as claimed in Claim 1, wherein the film material is partially or completely printed before the deforming process.
11. (Previously presented) The method as claimed in Claim 10, wherein the film material is printed with distortion-

sensitive contents, such as writing, logos or trade marks in a region which is only slightly distorted during the deforming process.

12. (Previously presented) The method as claimed in Claim 10, wherein the film material is printed with an undistorted printed image.
13. (Cancelled)
14. (Previously presented) The method as claimed in Claim 1, wherein the positive or the negative mould is unheated.
15. (Previously presented) The method as claimed in Claim 1, wherein the positive or the negative mould are heated and brought to a predetermined temperature.
16. (Previously presented) The method as claimed in Claim 1, wherein the positive or the negative mould are subjected to a partial vacuum.
17. (Previously presented) The method as claimed in Claim 1, wherein the film material is heated and deformed during a deformation time between the positive and a negative mould, the tension in the film material being relieved in a controlled manner during the deformation time or after a recovery time after the end of the deformation time.
18. (Previously presented) The method as claimed in Claim 17, wherein the recovery time can be up to several seconds long.
19. (Previously presented) The method as claimed in Claim 1, wherein the flexible film material is delivered to a

deforming station in cycles, such that a number of receptacle depressions are formed simultaneously with each stroke of the cycle, with margins of the web being kept under controlled tension

20. (Previously presented) The method as claimed in Claim 19, wherein the film material is delivered in the form of a continuous web or in the form of individual blanks.

21. (Currently amended) A method of manufacturing a product packed in flexible film material, especially a food product, comprising the steps of:

providing a positive and negative mould ~~each having a lower edge portion and a central upper portion;~~

~~placing a film material between the positive and negative moulds, the film material having edge portions;~~

forming a single receptacle depression in the film material between the moulds;

~~providing tension on the film material in order to stretch it without forming creases in a central portion of the depression;~~

~~controlling and reducing the tension of the film material while it is being moulded in order to draw; wherein additional film material is allowed to penetrate between the positive and negative moulds in order to form which~~

lateral creases are formed in the film material around the entire ~~lower edge portion of the mould~~ film material while the film material in the central upper portion of the mould retains its original shape during the deforming procedure; and

placing a product to be packed in the receptacle depression.

22. (Previously presented) The method as claimed in Claim 21, wherein the food product is introduced into the receptacle depression in a free-flowing state.
23. (Currently amended) The method as claimed in Claim 21, wherein ~~the receptacle depression along the lower edge~~ portion of the film material of the receptacle is sealed; ~~especially with a sealing film.~~
24. (Currently amended) The method as claimed in Claim 23, wherein a peripheral sealing rim or seam is formed; ~~especially by bonding or ultrasonic welding.~~
25. (Currently amended) A device for permanently deforming a flexible film material, the device comprising:
a positive and negative mould ~~each having a lower edge portion and a central upper portion~~ and a means for holding peripheral regions of the film material on the positive or negative mould; wherein film material having edge portions is placed between the positive and negative moulds;
the means for holding peripheral regions of the film material provides tension on the film material in order to stretch the film material without forming creases in a central portion of the material;
the means for holding peripheral regions of the film material further provides for reducing the tension of the film material is controlled and reduced while it is being moulded in order to draw; whereby additional film material is allowed to penetrate between the positive and negative mould in which order to form controlled lateral creases are formed in the film material around the entire lower edge

portion of the ~~moulds~~film material and a receptacle depression is formed in the central portion of the film material ~~in the central upper portion of the moulds~~ which retains its original shape during the deforming ~~procedure~~procedure.

26. (Previously presented) The device as claimed in Claim 25, wherein the positive or the negative mould can be connected to a vacuum source.
27. (Previously presented) The device as claimed in Claim 25, further comprising a heating means for heating the film material to a controlled temperature.
28. (Previously presented) The method of claim 21, wherein the product to be packed is a food product .
29. (New) The method of claim 1, wherein the flexible material is less than 150 μM thick.
30. (New) The device of claim 25, wherein the tension applied to the film material is applied by moveable and adjustable clamping elements.
